Stream Underground
Rainwater Harvesting System

PuraTANK

Common Applications

- ✓ Garden irrigation
- ✓ Watering borders, beds and planters
- ✓ Lawn and general outdoor watering
- ✓ Hose-fed garden use
- ✓ Car washing
- ✓ Greenhouse watering
- ✓ Outdoor cleaning tasks

ACC.RWH-STR

Stream Underground Rainwater Harvesting System

The System

The Stream Rainwater Harvesting System is a simple and effective solution for collecting and reusing rainwater for garden applications. Designed for everyday outdoor use, it captures rainwater in the tank and pumps it to the point of use whenever needed.

Ideal for tasks such as garden irrigation, hose-fed watering, car washing, and general outdoor cleaning, Stream offers a practical way to reduce mains water use and make better use of natural rainfall around the garden.

1. Best One Pump

The BEST ONE is a stainless steel, submersible water pump designed for clean water applications. It sits on the bottom of a tank and provides reliable performance for a range of uses, including garden irrigation, water transfer, and general outdoor water supply.

2. Rodent Guard

This guard protects the internal water from rodents and large debris which could contaminate the water entering via the overflow

3. Patronen Filter

The PF filter is designed with a level drop, this along with its very smooth surface structure allows excess dirt to be rinsed straight through into the sewer or overflow. The filter cartridge mesh is stainless steel within plastic housing and is self-cleaning, though regular inspection is recommended

4. Pump Turret

The 140 pump turret is a flexible plastic connection between the pump and access port allowing smooth flow of the pumped water out towards the application.

Additional Specification

- Pump lifting chain
- Delivery hose (options available)
- Tanks sold separately
